

Event Handling functions

<code>\$(selector).on(event,function)</code>	It will assign function as event handler
<code>\$(selector).off(event,function)</code>	It will remove function from event
<code>\$(parentselector).delegate(childselector,event,function)</code>	It will assign function as event handler, but the function will be associated with parent, and will be applicable to all children elements whose selector matches
<code>\$(parentselector).undelegate(childselector,event,function)</code>	It will remove function as event handler from the parentselector
<code>\$(selector).one(event,function)</code>	This function will be assigned as event handler for executing only once ,

AJAX

AJAX(Asynchronous Javascript and XML)

1. When we want to replace portion of the page then we use AJAX
 - a. In a form if we select country, then the dropdown of state should get populated
 - b. After login to the site, it shows welcome username

```
$.ajax({
```

```
url://url string, // http://localhost:5500/xyz?name=xxx&addr=yyy
```

```
type: //method(GET,POST,PUT,DELETE)
```

```
data: //query string only when post
```

```
success:function(){}  
error:function(){}  
})
```
